World Health Indicators Analysis Dashboard

About the Project

What if you could explore global health trends and compare health indicators across countries through a single interactive dashboard?
The **World Health Indicators Analysis Dashboard** is a Business Intelligence project developed using Microsoft Power BI to transform structured health data into meaningful insights. The dashboard is designed to help users explore health indicators across countries and World Health Organization (WHO) regions through interactive visualizations, data comparisons, and trend analysis.

The project focuses on understanding how health indicators vary across countries, how they change over time, and how health outcomes differ across demographic groups. By organizing the data around Country, WHO Region, Year, Indicator, Sex, Age Group, Value, Unit, and Data Status, the dashboard provides a structured approach to exploring global health information.

Users can interact with the dashboard using filters for country, year, health indicator, WHO region, sex, and age group. These interactive features make it possible to examine specific populations, compare health measurements across regions, and identify patterns within the available data.
The dashboard emphasizes data-driven analysis and visual storytelling. Through KPI cards, trend charts, country comparisons, demographic analysis, and geographical visualizations, it aims to make complex health information easier to understand and interpret.
By combining data cleaning, transformation, analytical measures, and interactive reporting, this project demonstrates how Power BI can be used to explore global health indicators and support evidence-informed discussions about public health.

Project Highlights

- Interactive Power BI Health Dashboard

- Global Health Indicators Analysis
- Country-wise and WHO Regional Comparisons
- Dynamic Filters and Interactive Slicers
- KPI Cards for Key Health Metrics
- Health Trends Over Time
- Age Group and Sex-based Analysis
- Geographical Health Data Visualization
- Data Quality and Reporting Status Analysis
- Detailed Health Indicator Reporting

Tech Stack

- Microsoft Power BI
- Power Query
- DAX (Data Analysis Expressions)
- Excel / CSV Dataset
- Data Cleaning and Transformation
- Data Modeling
- Data Visualization
- Business Intelligence
- Interactive Dashboard Development
-

Key Analytical Objectives

- Compare selected health indicators across countries and WHO regions.
- Explore changes in health measurements over time.
- Examine differences between demographic groups using age and sex.
- Identify geographical patterns in the available health data.
- Evaluate data availability and reporting status.
- Present complex health information through clear, interactive visualizations.
-

Skills Demonstrated

Data Cleaning • Data Transformation • Data Modeling • DAX • Power BI Dashboard Development • Business Intelligence • Data Visualization

• Exploratory Data Analysis • Analytical Thinking • Data Storytelling • Interactive Reporting
